

I fully support RM-10352 which separates narrow-mode communication from wide-band modes. As an Amateur for over 15 years I've seen an increase in the amount of activity on 160 meters and seek to ensure the efficiency of narrow mode communications by protecting it in its own bandspace. The other HF Amateur bands are similarly protected and doing so would accommodate all users with minimum interference. Using the precedent set by the band plans from the other HF Amateur bands will provide the Commission means to achieve this with minimal Commission resources and reduce conflicts between narrow and wide band modes. All will benefit from this. Thank you for your time.
